

This fictional city brief was created for teaching RAG retrieval and evaluation.

Sunford is a fictional inland city where summer nights are getting warmer. The heat action plan focuses on the urban heat island in Oak Market, South Loop, and the eastern warehouse district. Local sensors show that paved streets can stay 6 C warmer than parks after sunset.

The city defines a heat alert as two forecast days above 32 C or one night above 24 C. When an alert is active, libraries, sports halls, and two school cafeterias become cooling centers. The plan prioritizes elderly residents, people without air conditioning, outdoor workers, and families with infants.

Sunford will plant 12,000 shade trees over five years. The first planting corridors are bus stops, school walking routes, and streets with high elderly populations. Tree maintenance is funded for the full period because previous planting efforts failed when young trees were not watered during drought weeks.

Public housing blocks in Oak Market will receive cool roof coatings and reflective courtyard surfaces. The plan treats these as heat mitigation measures because they lower neighborhood temperatures before an emergency happens. Cooling centers and outreach vans are heat response measures because they help people during an active heat event.

Outdoor worker outreach is run with unions and large employers. During red alerts, construction sites must shift heavy work away from early afternoon where possible. Outreach vans distribute water, shade tents, and heat illness cards in multiple languages. The cards describe dizziness, confusion, and stopped sweating as warning signs.

The communication system combines text messages, radio announcements, and door-to-door checks. A heat-health SMS alert is sent when the forecast threshold is crossed. Community volunteers then contact registered high-risk residents. The plan says digital alerts alone are not enough because the residents most at risk may not check phones regularly.

The evaluation target is a 30 percent reduction in heat-related ambulance calls from Oak Market within four summers. The plan also tracks night temperature, cooling center visits, and tree survival. Sunford expects slow improvement because shade trees need time to mature.
