

This fictional city brief was created for teaching RAG retrieval and evaluation.

Northbridge is a fictional regional transport hub with trams, buses, and a central rail station. Extreme rain, heat, and power disruption are the main climate risks for the network. The most fragile points are Central Underpass, the Riverside tram depot, and the hospital bus corridor.

The transport plan installs new pumps and water sensors at Central Underpass. When water reaches the first warning level, the traffic control room receives an automatic alert. If the second warning level is reached, buses are diverted before cars are trapped. The city wants the underpass closed early rather than late.

For the tram system, Northbridge will raise electrical cabinets at Riverside depot and inspect overhead wires before heat waves. Shade canopies are planned for 18 exposed tram stops. These canopies reduce passenger heat stress and protect ticket machines from direct sun. The city treats passenger safety and equipment reliability as one problem.

Backup bus route B-12 is the core continuity measure. If tram service fails between Riverside depot and the hospital district, B-12 connects the central station, the hospital, and two large housing estates. The route is rehearsed twice per year so drivers know temporary stops before an emergency.

Mobility access is a separate section, not an afterthought. Northbridge requires real-time elevator status at the central station and accessible shuttle vans during major disruptions. The plan says transport resilience fails if wheelchair users, older passengers, and parents with strollers receive information too late to change plans.

The communications team will publish disruption messages in three levels: advisory, service change, and emergency closure. Messages must name the affected line, the reason, the expected duration if known, and the accessible alternative. The plan avoids vague phrases such as severe weather disruption without practical instructions.

The first-year budget is 5.1 million city credits. The main success measures are fewer weather-related service hours lost, faster underpass closure decisions, and better passenger satisfaction during disruptions. Northbridge expects some service interruptions to remain, but it wants them to be shorter, clearer, and less dangerous.
